

# Losing bank customers

- Every bank wants to hold their customers for sustaining their business and thus this Anonymous Multinational bank. You have customer data of account holders at Anonymous Multinational Bank with the aim of understanding • exploring the correlation between variables such as credit score, age, tenure, balance, and geography with customer churn. Assess the impact of demographic factors like gender and the presence of credit cards on churn rates. • Additionally, analyze customer satisfaction scores and complaint resolutions to identify areas for service improvement. Utilize your analytics skills to find factors contributing to potential churn based. This project provides an opportunity to enhance customer retention strategies by uncovering patterns and insights within the dataset.

## Losing bank customers

### Data description

RowNumber—corresponds to the record (row) number and has no effect on the output.

CustomerId—contains random values and has no effect on customer leaving the bank.

Surname—the surname of a customer has no impact on their decision to leave the bank.

CreditScore—can have an effect on customer churn, since a customer with a higher credit score is less likely to leave the bank.

Geography—a customer's location can affect their decision to leave the bank.

Gender—it's interesting to explore whether gender plays a role in a customer leaving the bank.

Age—this is certainly relevant, since older customers are less likely to leave their bank than younger ones.

Tenure—refers to the number of years that the customer has been a client of the bank. Normally, older clients are more loyal and less likely to leave a bank.

Balance—also a very good indicator of customer churn, as people with a higher balance in their accounts are less likely to leave the bank compared to those with lower balances.

NumOfProducts—refers to the number of products that a customer has purchased through the bank.

HasCrCard—denotes whether or not a customer has a credit card. This column is also relevant, since people with a credit card are less likely to leave the bank.

IsActiveMember—active customers are less likely to leave the bank.

EstimatedSalary—as with balance, people with lower salaries are more likely to leave the bank compared to those with higher salaries.

Exited—whether or not the customer left the bank.

Complain—customer has complaint or not.

Satisfaction Score—Score provided by the customer for their complaint resolution.

Card Type—type of card hold by the customer.

Points Earned—the points earned by the customer for using credit card.

1	95	232	201	213	203	209	196	177	197	214	101	2038	
All	413	1035	1048	1009	989	1012	967	1028	1025	984	490	10000	

```
In [77]: churn_data = pd.crosstab(columns = data['Tenure'],index= data['Exited'],norm
churn_data
```

```
Out[77]:
```

	Tenure	0	1	2	3	4	5	6	
Exited	0	0.769976	0.775845	0.808206	0.7889	0.794742	0.793478	0.797311	0.8
1	0.230024	0.224155	0.191794	0.2111	0.205258	0.206522	0.202689	0.1	

```
In [78]: churn_data[1:2].reset_index()
```

```
Out[78]:
```

Tenure	Exited	0	1	2	3	4	5
0	1	0.230024	0.224155	0.191794	0.2111	0.205258	0.206522

from above table the 2nd rows show the churning rate for every different tenure

```
In [81]: warnings.simplefilter(action='ignore', category=FutureWarning)

sns.barplot(churn_data[1:2].reset_index().drop('Exited',axis = 1))
plt.show()
```

The Customer churning are dependent on Variables like Credit Score ,Age and Geography Tenure has no relation with customer who churned

### Recommendation:

Focus on Customer with Credit score between 600-700 as they are more likely to churn. Keep a guard rail check on the 30-40 year of age people as they are loyal customers the Age from 40 - 50 were the mostly who churned so incentivize them too so they not churned in future Gender has an impact on churning so and incentives for gender can benefits the customer Focus on credit card service and bring innovation as people who left were most of who have credit card with them

```
In [ ]:
```

# Observation & Recommendation:

The Customer churning are dependent on Variables like Credit Score ,Age and Geography, Balance Tenure has no relation with customer who churned

Recommendation Focus on Customer with Credit score between 600-700 as they are more likely to churn.

Keep a guard rail check on the 30-40 year of age people as they are loyal customers ,the Age from 40 – 50 were the mostly who churned so incentivize them too so they not churned in future

Gender has an impact on churning so an incentives for both gender can benefits the customer

Focus on credit card service and bring innovation as people who left were most of who have credit card with them

Geography especially France as most customer centric and Balance should be considered for predicting the next possible churn

## Conclusion

Customer leaving the bank makes a significant impact on firm reputation and leads to financial loss and in order to deal with this crisis a comprehensive data analysis needed for making an informed decision by decision makers
